

**Front End Technology****CSS****Duration:****CSS Page Adjustments**

1. A page which specify a black border for table and if hover on it, page should change it's colour.
2. Apply different visibility by an element (visibility: hidden, visible, collapse) and use different types of display for an element (display: none, inline, block, contents, list-item)
3. A long page which should have two links "click to go to bottom of page" and "click to go to top of page" . Also set their scroll-behavior to scroll smoothly.
4. Add padding and margin with different size and understand the difference between them.
5. A page with multiple background images for an webpage or element and define their adjustable sizes.

**Things to know:**

1. Difference between visibility:hidden and display:none?
2. Difference between inline and block level elements?
3. What are selectors?
4. Which property is used to set the line style for the outline?
